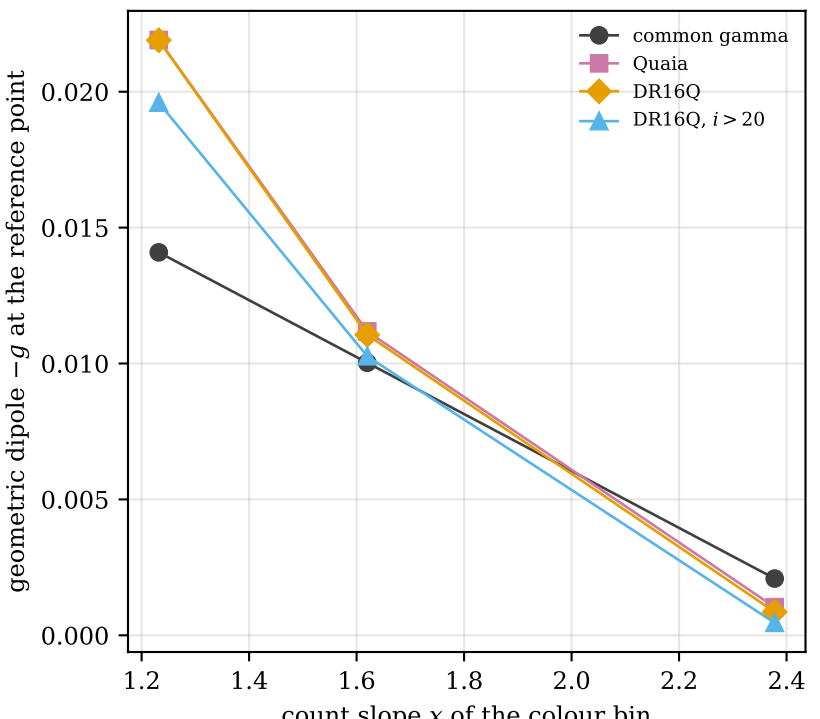
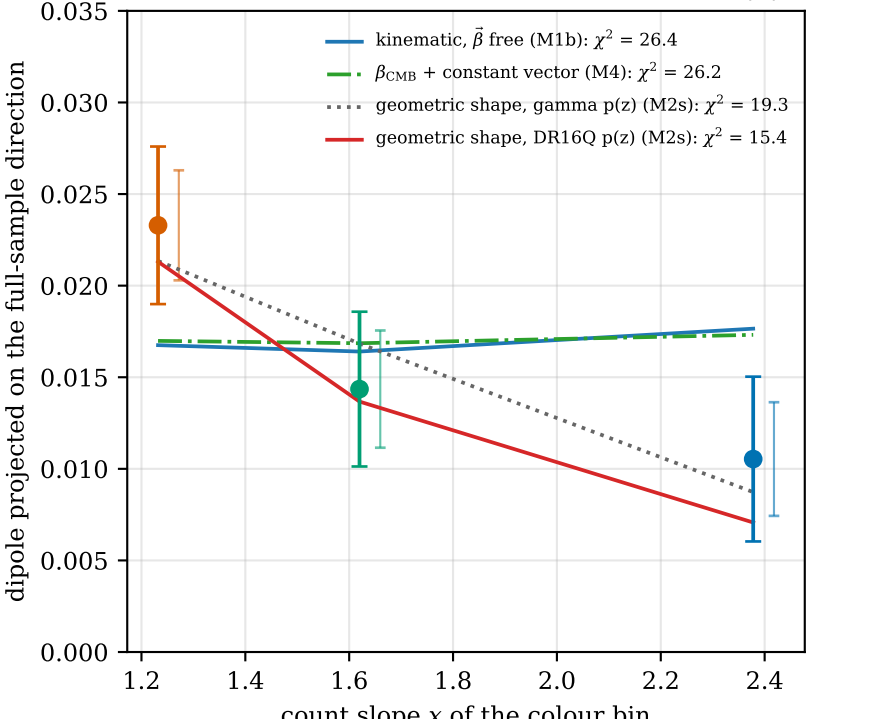
(a) redshift distributions
W1−W2 0.80−0.95, DR16Q
W1−W2 0.80−0.95, Quaia
W1−W2 0.95−1.15, DR16Q
W1−W2 0.95−1.15, Quaia
W1−W2 ≥ 1.15, DR16Q
W1−W2 ≥ 1.15, Quaia
common gamma p(z)
p(z) of the matched sources
redshift z



(b) model amplitude with each p(z)
common gamma
Quaia
DR16Q
DR16Q, i > 20
geometric dipole −g at the reference point
count slope x of the colour bin



(c) colour bins, errors: jackknife (thick), Poisson (thin) (|b| > 30°)
kinematic, β⃗ free (M1b): χ² = 26.4
β_CMB + constant vector (M4): χ² = 26.2
geometric shape, gamma p(z) (M2s): χ² = 19.3
geometric shape, DR16Q p(z) (M2s): χ² = 15.4
dipole projected on the full-sample direction
count slope x of the colour bin
